|                          | 225              |     |

Note: Combined type is also available for type RF.

Note: When equipping the user's motor or the special one, the flange is required to connected.(Please see appendix D)

## Features of Products

**1.Highly Standard Modular Designed:** The products are easily connected with and driven by different types of motors or other kinds of input power. The same type geared motor can be adapted to optioned powers of motors. It is therefore easy to realize different solutions for varied requirements.

**2.Ratio:** Featured many closely divided ratios and wide range of them. Very big final ratios can be obtained through combined unites to reach extremely low output speeds.

**3.Mounting Arrangement:** No strict limitation to the mounting arrangement.

**4.High Strength, Compact Dimension:** Housings are made of high strength cast iron. Gears and shaft gears are finished with gas carburising process and precise grinding to sequentially get high loading capacity of per certain volume.

**5.Long Service Life:** Under the condition of accurately selecting type size and the normal maintenance and use, main components ( except those easily-disabled parts ) can last as long as up to more than 25,000 hours. Easily-disabled parts include lubricating oil, oil seals, and bearings.

**6.Low Noise:** All key components are finished by precisely machining, accurate assembly, and finally tested, and therefore, fairly low noise is reached.

**7.High Efficiency:** The efficiency of gear unit can reach 95%, The efficiency of worm gear unit can reach 89%.

**8.Large radial loading ability:**

**9.Axial load ability of up to 5% of radial load.**

### Site Conditions

The geared motors are suitable for the operation sites in the ambient temperatures from -10°C to 40°C and altitudes up to 1000m above the sea lever.

They can be used both for clockwise running and anti-clockwise running.

There is no limitation to specific application field.

While applied in other aggressive operating atmosphere or environment conditions, please contact our technology department.

## Description of Selection Tables

### 1.Selection Table [ Constant Power ]:

**Motor Power P<sub>m</sub>[ kW ]:** Power is indicated on the basis of Y<sub>2</sub> motor.

**Output Speed n<sub>2</sub>[r/min ]:** Output speed is calculated on the basis of motor's fully loading speed and geared motor's ratio. Unit: revolutions per minute.

**Output Torque M<sub>2</sub> [ Nm ]:** Torque available at output shaft while motor being fully loaded. All internal efficiency factors have already considered.

**Ratio [ i ]:** Exact final total transmission ratio from input to output

**Permissible Radial Load F<sub>ra</sub>[ kN ]:** Permissible radial load on the middle point of overhung shaft ( F<sub>ra</sub> value listed in the table must be multiplied by 0.4, if load is placed on the end point of the shaft ). The mathematic product of actual radial load Fr and actual service factor f<sub>A</sub> should not be bigger than this F<sub>ra</sub>, i.e. F<sub>ra</sub> ≥ f<sub>A</sub>\*Fr (for f<sub>A</sub>, please see the description of f<sub>B</sub> ).

Normally, Fr of a working unit can be got through the following:

$$Fr = M_r * f_r / r \quad ( N )$$

where, M<sub>r</sub> - working torque of the working unit (Nm)

r - pitch circle radius of the working unit (m)

f<sub>r</sub> - radial load factor, which can be got refer to

the following:

f<sub>r</sub>=1, for single chain sprocket wheel

f<sub>r</sub>=1.25, for single gear or for double chain sprocket wheel

f<sub>r</sub>=1.5, for V-section belt

f<sub>r</sub>=2.5, for flat belt

**Service Factor f<sub>B</sub>:** The ratio of rated power of gear unit to rated power of motor power. It is essential data to select the size and strength of gear unit.

**Type Size of Unit:** including type and size. Individual unit and combined units are available. Combination is considered commonly under the constant power condition. Each type ( and even some other types not mentioned in the tables ) can be assembled or combined to any ratio mentioned in the tables.

For the detailed construction dimension, see the relevant dimensional tables.

**Pole Number of Motor:** The pole number of Y<sub>2</sub> motor.

**Mass (Weight) [kg]:** Net weight of geared unit, without the motor. This weight is only for your general reference.

### 2.Selection Table ( Constant Torque):

Constant torque selection table is suitable for the conditions where the constant torque system is applied appropriately. If the Max. torque listed in this table is used when calculating, service factor is 1.0. The meanings of other terms are similar to ones described in Selection Table (Constant Power).

## Selection Steps

### 1、 Type Selection

Types of units are normally selected by customers to meet transmission mounting arrangement requirement. Series R and series F are applied to the conditions that input shafts are parallel to output shafts. And, series S and series K are applied to the conditions that input shafts are vertical to output shafts.

### 2、 Selection of actual Service Factor $f_A$

#### 1)、 Normal requirement

$f_A$  is determined by load feature, operating hours, and starts and stops number per hour of working unit. The normal total combined service factor is calculated as follows:

$$f_A = f_{Ah} * f_{Ac}$$

Where:  $f_{Ah}$ -the factor determined by load feature and operating hours of per day. See the table of  $f_{Ah}$ . The other working unit's  $f_{Ah}$  out of the table could be determined by analogy.

$f_{Ac}$ -the factor determined by number of starts and stop per hour of working unit.

Attention: the number should be counted even start or stop.

#### 2)、 Special requirement

If the ambient temperature is special high, the temperature factor  $f_{At}$  should be considered. refer to the factor  $f_{At}$  column of selection table.

If requiring higher reliability, the security factor  $f_{As}$  should be considered.

When you can't select the value of service factor, please contact with us.

### 3、 Selection of Type (Size)

It is essential to meet following:  $f_B \geq f_A$

#### 1)、 For constant power

##### (1)、 The motor is mounted directly into gear unit or with coupling

a, Reach to a relevant power and pole number of motor from selection table (constant power)

b, Select rudely a size with close ratio, and record it's  $f_B$ .

c, Compare, if meet this formula:  $f_B \geq f_A$ , then this size of gear unit is available. Otherwise select a bigger size of gear unit until meet it.

##### (2)、 The gear unit with prefixion deceleration unit

When connecting the motor and gear unit using gears, belts or chains, etc. Because the torque of input has been increased, so it is essential to convert motor power into input power of gear unit, the input power is to multiply motor power by radio. Select the size according to the power converted from the selection table. Attention: the number of motor pole is same.

#### 2)、 For constant torque

Select the size of gear unit according to the power and pole of motor and radio from selection table (constant torque). It is essential to restrict the working torque under maximal torque of gear unit selected.

#### 4、 Radial Load Checking

It will checking overhuang load, if the gears, belts and chains, etc, are fired on the shaft of the gear motors. For checking method, refer to the relevant contents in fore-named description of selection table.

#### 5、 Mounting Dimension Checking

Check the mounting dimension when there is a limitation to site mounting condition.

If the selected type by the above method is appropriate to site mounting condition, this final type is standard and should be written in formal type description. If any special requirement is requested, please describe it while placing order.

#### Normal Delivery Condition:

1、 Motor: Y2 motor of protection class IP54 and of insulation class F, while no special request. But this insulation class F motor is generally recommended to be used in the condition where the class B is required.

2、 Terminal box: Terminal box is at 0° position if no special request (see description of motor terminal box position).

3、 Rotation direction: There will be no mark of rotation direction for input shaft or output shaft, if the relationship between input shaft and output shaft is not requested.

4、 Lubricants: Units are supplied with lubricant oil before delivery.

5、 Accessories: Generally, accessories excluded in mounting dimension table do not belong to our standard supply.

**Design and specifications are subject to change without notice, Please forgive.**

**Service Factor  $f_{Ah}$** 

| Application                               | 8 hours / day | 16 hours /day | 24 hours /day |
|---|---------------|---------------|---------------|

\*=0.8, if hours of operation<3 hours/24 hour and no radial overhung load is applied.

These service factors are recommended on the basis of AGMA and ISO specifications and our experiences. They apply for electric motors as prime movers preferably. For specially designed applications, e.g. large inertia factor, please contact our technology department.

## Overhung loads

The approved overhung loads given in the selection tables must be calculated using the following formulae in the event of force application not in the center of the shaft end.

|                  |                                   |     |
|------------------|-----------------------------------|-----|
| $0 \leq X < L/2$ | $F_x = [1.25 - (X/2L)] * F_{ra}$  | [N] |
| $X = L/2$        | $F_x = F_{ra}$                    | [N] |
| $L/2 < X \leq L$ | $F_x = [1.6 - (1.2X/L)] * F_{ra}$ | [N] |

$F_{ra}$ — Approved overhung loads ( $X=L/2$ ) for foot-mounted gear units according to the selection tables in [N]

$F_x$ — Approved overhung loads of formulae in the event of force application in [N]

$X$ — Approved overhung loads of formulae in the event of force application in [N]

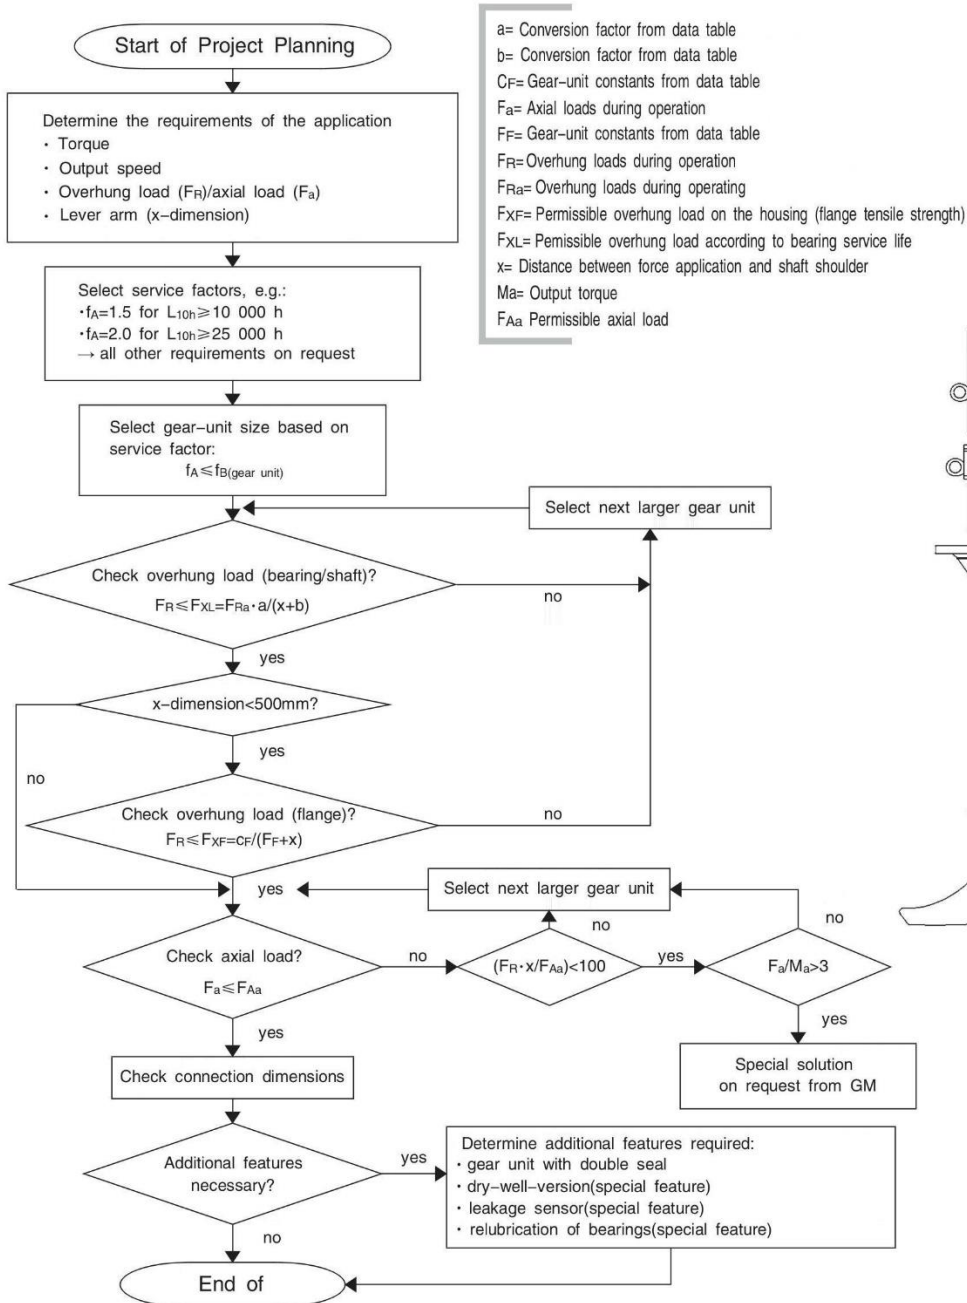

$L$ — Length of output shaft in [mm]

The mathematic product of actual overhung loads  $F_r$  and actual service factor  $f_A$  should not be bigger than the approved overhung loads of formulae in the event of force application  $F_x$ , i.e.  $F_x \geq f_A * F_r$ . (Please see Page.2)

## Selection procedure of RM..

### RM geared motors

RM geared motors are a special type of helical geared motor with an extended output bearing housing. They are specially designed for agitator applications and can be used in applications subject to high overhung and axial loads as well as flexural torque. The remaining data correspond to the standard helical geared motors. You can find special project planning notes for RM geared motors in "RM gear units" in the "Project Planning for Gear Units" section.

### Permitted overhung and axial loads

The permitted overhung loads  $F_{Ra}$  and axial loads  $F_{Aa}$  are specified for various service factors  $f_B$  and nominal bearing service life  $L_{H10}$ .

$$f_A=1.5/L_{10h}=10\ 000h$$
